Proposed Features, Prioritization & Success Metrics

Proposed Solution

A structured Alert Dashboard built around the real incident lifecycle:

Triage → Investigate → Resolve

Instead of adding unnecessary features, the design focuses on simplicity, clarity, and operational flow.

Screen 1: Alert Dashboard (Triage)

Purpose: Enable fast prioritization.

Key Features:

- Top navigation bar
- Filter bar (Severity, Cloud, Status, Time Range)
- Summary metrics (Open Alerts, Critical, SLA Breaches, MTTR)
- Alert table with essential columns:
    - Severity
    - Alert Name
    - Resource
    - Cloud
    - Status
    - Owner
    - Time
    - SLA countdown
- Color-coded severity indicators

Impact: Helps analysts quickly identify what needs immediate attention and reduces decision time.

Screen 2: Investigation View

Purpose: Reduce investigation time and tool switching.

3-Column Layout:

- Left: Alert context & impacted resource
- Center: Timestamped logs with tabs
- Right: Recommended actions and containment buttons

Actions are always visible to avoid extra clicks.

Impact: Speeds up investigation and containment, reducing MTTR.

Screen 3: Resolution Screen

Purpose: Ensure structured closure and knowledge retention.

Features:

- Root cause classification dropdown
- Actions taken checklist
- Impact summary field
- Lessons learned section
- Close alert button

Impact: Improves documentation quality and prevents repeated incidents.

Prioritization Rationale

1. **Triage efficiency (Highest priority)**
   Faster prioritization directly reduces MTTR and SLA breaches.
2. **Investigation support (Second priority)**
   Most analyst time is spent analyzing logs and deciding actions.
3. **Resolution documentation (Third priority)**
   Ensures long-term learning without slowing active response.

The system intentionally avoids feature overload and focuses on:

- Clear visual hierarchy
- Minimal but meaningful data
- Persistent action visibility
- Simple navigation
- Enterprise-ready clean design

Success Metrics

Operational Metrics

- 20–30% reduction in MTTR
- Reduction in SLA breaches
- Faster alert ownership assignment
- Reduced investigation time

Behavioral Metrics

- Increased percentage of alerts with documented root cause
- Fewer clicks to resolve an alert
- Higher filter adoption rate

Conclusion

This Alert Dashboard is not just a monitoring interface — it is a workflow optimization tool.

By aligning the interface with real-world security operations, the system:

- Reduces cognitive overload
- Improves response speed
- Increases accountability
- Supports long-term operational resilience

The result is a simple, scalable, and efficient solution that enhances both immediate response effectiveness and long-term security maturity.
